[**Prevalence and Factors Associated with the Occurrence of Acute Diarrhea in Children Aged 0 to 59 Months at the Mirebalais University Hospital**](#)

Analytical cross-sectional study conducted among 230 parents with children aged 0-59 months randomly selected from different sectors of the pediatrics department from May 1 to 31, 2022. Data were collected from guided face-to-face interviews by a structured questionnaire in Haitian Creole. They were analyzed using Jamovi 2.3.9 software at a 95% confidence interval. Descriptive analysis and binary logistic regression were performed. Our survey revealed a high prevalence of diarrhea in children under 5 years old seen in consultation or hospitalized at the Mirebalais University Hospital. The factors associated with this high prevalence are the level of education of the parents, access to information and the use of natural purgatives. Health education campaigns on ways to prevent diarrhea in children could prove useful in the strategy to reduce this phenomenon.
